1 The ARI Protocol

1.1 Architecture

For an overview of the architecture of the Adapter Remoting Infrastructure and the necessary server configurations, please refer to the "Adapter Remoting Infrastructure.pdf" file, available in the Lightstreamer distribution under the "docs" folder (or the "adapter_remoting_infrastructure" folder for Server version earlier than 7.2).

1.2 Protocol Basics

The following are the basic principles of the ARI protocol:

- there are three unidirectional channels: requests, replies and notifications;
- every protocol packet represents a single request, reply or notification;
- requests are sent only from Proxy Adapters, replies and notifications are sent only from the counterpart (i.e.: the Remote Adapter);
- every request is identified by a unique ID that must be repeated as the ID of its corresponding reply; for some kinds of notification, the ID of the request that originates the notification is required;
- each notification is time stamped with a [Java compatible millisecond resolution date-time](#) (for statistical purposes);
- request, reply and notification packets are simple pipe-separated text lines, terminated by a line-feed or carriage-return & line-feed pair;
- every request, reply and notification must carry the information on which interface method it refers;
- requests and replies are completely asynchronous, i.e.: there is no need to answer a request before reading, and possibly answering, the next one (notifications are one-way only, so they are obviously asynchronous);
- keepalive packets originated by a Remote Adapter are allowed, in order to prevent network intermediate nodes from dropping the connections because of inactivity; the keepalive packets are simpler than request, reply and notify packets.

This implies that:

- in order to ensure that data can be transported by text lines, they must be encoded accordingly;
- in order to ensure that correct decoding can be applied for each data segment, corresponding data types must be specified;
- in order to ensure asynchronous request/reply, a pair of queue & de-queueing-thread must be created for each channel (request, replies and notifications);
- in order to ensure correct statistical treatment of notification timestamps, in case the counterpart runs on a separated machine the two machines must be synchronized through NTP or equivalent network time protocol (this is actually optional, statistics can be ignored and time-stamp set to 0).

1.3 Packet Structure

The general structure of a protocol packet is as follows:

- request and reply packets:

```
<ID>|<method>|<data type 1>|<data segment 1>|...|<data type N>|<data segment N>\r\n
```

- notification packets:

```
<timestamp>|<method>|<data type 1>|<data segment 1>|...|<data type N>|<data segment N>\r\n
```

- keepalive packets:

```
KEEPALIVE\r\n
```

Where, as pointed out above, the lines may also terminate with just `\n`, possibly depending on the system the originating peer runs on.

Each data segment typically represents the content of a field or argument of a method, and the corresponding data type represents the native type in which it is expressed. There are a few cases where the structure above is not respected, particularly in the case of handling of counterpart-generated exceptions. See on for more details.

1.4 Data Types and Encodings

String

Data type: S

Encoding:

- # if null
- \$ if empty
- standard [WWW UTF-8 url-encoding](#) in any other case

Byte array (signed or unsigned)

Data type: Y

Encoding:

- # if null
- \$ if empty
- standard in-line [BASE-64 encoding](#) in any other case

Boolean

Data type: B

Encoding:

- 0 if false
- 1 (or any other value) if true

Integer (32 bit, signed)

Data type: I
 Encoding: simple string representation of the integer

Double (64 bit, signed, IEEE 754 formatted)
 Data type: D
 Encoding: simple string representation of the double, with decimal point (not comma)

In addition to these simple native types there are structured types, like exceptions and mode arrays, and the “no data” type:

Void (i.e.: no data)
 Data type: V
 Encoding: not encoded, data segment is simply not present

Mode array

Data type: M
 Encoding:

- # if null
- \$ if empty
- a character sequence in any other case, where each character represents a mode as per the following table:

Character	Mode
R	Raw
M	Merge
D	Distinct
C	Command

Exception

Exceptions can be of generic type or of different subtypes, as per the following table:

Type of exception	Data type	Encoding
Generic	E	string-encoding of detail message
Failure	EF	string-encoding of detail message
Metadata	EM	string-encoding of detail message
Data	ED	string-encoding of detail message
Subscription	EU	string-encoding of detail message
Access	EA	string-encoding of detail message
Items	EI	string-encoding of detail message
Schema	ES	string-encoding of detail message
Notification	EN	string-encoding of detail message
Credits	EC	3 subsequent data segments with: <ul style="list-style-type: none"> • string-encoding of detail message • integer-encoding of client error code • string-encoding of user message

Type of exception	Data type	Encoding
Conflicting session	EX	4 subsequent data segments with: <ul style="list-style-type: none"> • string-encoding of detail message • integer-encoding of client error code • string-encoding of user message • string-encoding of conflicting session ID

Mobile Platform Type

Data type: P

Encoding: a character as per the following table:

Character	Platform
A	Apple Platforms (iOS, macOS, tvOS, etc.)
G	Google Platforms (Android, Chrome, etc.)

The available cases refer to the platform types currently supported.

1.5 Metadata Provider Protocol Methods

Metadata Provider protocol aims at exposing the MetadataProvider Java interface methods through the protocol. To reduce the protocol overhead, much of the original Java interface small methods have been aggregated in bigger protocol methods, carrying more information that are then cached on the Proxy Adapter side.

For more explanations regarding the semantics of each information, please consult the interface API documentation, either on Java API docs or (for an implementation example) on .Net API docs included in the distributions.

Not all methods available in the Java interface have been exposed for Remote Adapters. The Selectors and Customizers, which involve invocations of *isSelected* and *customizeUpdate* in the inner loop of data dispatching, cannot be used. As a consequence, *isSelectedAllowed* and *enableUpdateCustomization* are implemented by the Proxy Adapter to always return false.

Metadata Init

Direction: from Proxy Adapter to counterpart

Expects reply: yes

Method tag: MPI

Data segments:

- N *initialization parameter name-value pairs*, both names and values as string

The parameters are supplied by the Proxy Adapter based on its own configuration in an unspecified order.

A parameter named "ARI.version" will always be supplied, to carry the maximum protocol version supported by the Proxy Adapter.

A parameter named "keepalive_hint.millis", if present, specifies the inactivity time after which a keepalive packet should be issued on the reply channel to prevent the

Proxy Adapter from closing the channel for inactivity. Note that the value is a number, but encoded as a string.

```
<ID>|MPI|S|<param 1>|S|<param 1 value>|...|S|ARI.version|S|<version>|...|S|
<param N>|S|<param N value>
```

Expected reply data segments:

- *N initialization parameter name-value pairs*, both names and values as string

The supplied parameters are handled by the Proxy Adapter based on its own configuration and regardless of their order.

A parameter named "ARI.version" is mandatory, to carry the protocol version that the Remote Adapter is willing to use. Based on it, the Proxy Adapter will either proceed or interrupt the connection. If it is lower than the request's ARI.version, the Proxy Adapter may still support it and proceed. If it is higher, the Proxy Adapter will interrupt (the Proxy Adapter will recognize the response, regardless of its protocol version); in this case, returning a Generic Exception (see below) is also an option.

```
<ID>|MPI|S|<param 1>|S|<param 1 value>|...|S|ARI.version|S|<version>|...|S|
<param N>|S|<param N value>
```

Reply can be also an exception of *Generic* or *Metadata* type. This will cause the Proxy Adapter to interrupt the connection. The Proxy Adapter will recognize such response, regardless of its protocol version.

Examples:

```
→ 10000010c3e4d0462|MPI|S|ARI.version|S|1.8.2|S|keepalive_hint.millis|S|8000|S|
adapters_conf.id|S|DEMO|S|proxy_instance_id|S|hewbc3ikbbctyui|...
← 10000010c3e4d0462|MPI|S|ARI.version|S|1.8.2
```

```
→ 10000010c3e4d0462|MPI|S|ARI.version|S|1.8.2|S|adapters_conf.id|S|DEMO|S|
proxy_instance_id|S|hewbc3ikbbctyui|...
← 10000010c3e4d0462|MPI|S|ARI.version|S|1.8.2|S|user|S|remote1|S|password|S|
fdhjkslghak
```

```
→ 20000010c3e4d0462|MPI|S|ARI.version|S|1.8.2|S|custom:feed_name|S|feed1|S|
custom:feed_port|S|8080|...
← 20000010c3e4d0462|MPI|EM|Authentication Feed unavailable
```

Notify User

Direction: from Proxy Adapter to counterpart

Expects reply: yes

Method tag: NUS

Data segments:

- 1 *user name*, as string (can be null for the anonymous user)
- 1 *user password*, as string (can be null if no password is specified)
- *N http header name-value pairs*, both names and values as string
The last pair is added by the Server; the name is "REQUEST_ID" and the value is a unique id assigned to the client request.

```
<ID>|NUS|S|<user name>|S|<user password>|S|<header 1>|S|<header value 1>|...|S|
<header N>|S|<header value N>|S|REQUEST_ID|S|<id>
```

Expected reply data segments:

- 1 *allowed max bandwidth*, as double
Edition note: Bandwidth Control is an optional feature, available depending on Edition and License Type. To know what features are enabled by your license, please see the License tab of the Monitoring Dashboard (by default, available at /dashboard).
- 1 *wants table (i.e. subscription) notifications flag*, as boolean

```
<ID>|NUS|D|<allowed max bandwidth>|B|<wants table notifications flag>
```

As you can see, this method also integrates the *getAllowedMaxBandwidth* and *wantsTablesNotification* methods of the Java interface.

Reply can be also an exception of *Generic*, *Access* or *Credits* type; for Credits exceptions, the error code must be either 0 or negative.

Examples:

```
→ 10000010c3e4d0462|NUS|S|user1|S|password|S|host|S|www.mycompany.com|...
← 10000010c3e4d0462|NUS|D|40|B|0

→ 20000010c3e4d0462|NUS|S|#|S|#|S|connection|S|Keep-Alive|...
← 20000010c3e4d0462|NUS|EC|Anonymous+user+not+allowed|-1099|#
```

Notify User (extended version to carry identification data included in the client SSL certificate)

Edition note: https connections is an optional feature, available depending on Edition and License Type. To know what features are enabled by your license, please see the License tab of the Monitoring Dashboard (by default, available at /dashboard).

Direction: from Proxy Adapter to counterpart

Expects reply: yes

Method tag: NUA

Data segments:

- 1 *user name*, as string (can be null for the anonymous user)
- 1 *user password*, as string (can be null if no password is specified)
- 1 *client principal*, as string (can be null if client not authenticated)
- N *http header name-value pairs*, both names and values as string
The last pair is added by the Server; the name is "REQUEST_ID" and the value is a unique id assigned to the client request.

```
<ID>|NUA|S|<user name>|S|<user password>|S|<client principal>|S|<header 1>|S|
<header value 1>|...|S|<header N>|S|<header value N>|S|REQUEST_ID|S|<id>
```

Expected reply data segments:

- 1 *allowed max bandwidth*, as double
Edition note: Bandwidth Control is an optional feature, available depending on Edition and License Type. To know what features are enabled by your license, please see the License tab of the Monitoring Dashboard (by default, available at /dashboard).
- 1 *wants table (i.e. subscription) notifications flag*, as boolean

```
<ID>|NUA|D|<allowed max bandwidth>|B|<wants table notifications flag>
```

As you can see, this method, like its base version, also integrates the *getAllowedMaxBandwidth* and *wantsTablesNotification* methods of the Java interface.

Reply can be also an exception of *Generic*, *Access* or *Credits* type; for Credits exceptions, the error code must be either 0 or negative.

Examples:

```
→ 10000010c3e4d0462|NUA|S|user1|S|password|S|cn=john,cn=users,dc=acme,dc=com
|S|host|S|www.mycompany.com|...
← 10000010c3e4d0462|NUA|D|40|B|0

→ 20000010c3e4d0462|NUA|S|user1|S|password|S|#|S|connection|S|Keep-Alive|...
← 20000010c3e4d0462|NUA|EC|Unauthenticated+user+not+allowed|-1098|#
```

Notify New Session

Direction: from Proxy Adapter to counterpart

Expects reply: yes

Method tag: NNS

Data segments:

- 1 *user name*, as string (can be null for the anonymous user)
- 1 *session ID*, as string
- *N client context name-value pairs*, both names and values as string
The possible pairs differ from the java interface *notifyNewSession* case, because the "HTTP_HEADERS" property is not provided; a "REQUEST_ID" property is provided instead (see notes below).

```
<ID>|NNS|S|<user name>|S|<session ID>|S|<context prop name 1>|S|<context prop 1
value>|...|S|<context prop name N>|S|<context prop N value>
```

Expected reply data segments: none, a void is expected

```
<ID>|NNS|V
```

Reply can also be an exception of *Generic*, *Notification*, *Credits* or *Conflicting Session* type. In the last case, a second invocation of the command with the same "REQUEST_ID" and a different session ID will be received. For Credits or Conflicting Session exceptions, the error code must be either 0 or negative.

Examples:

```
→ 30000010c3e4d0462|NNS|S|user1|S|S8f3da29cfc463220T5454537|S|REMOTE_IP|
S|192.168.0.1|...
← 30000010c3e4d0462|NNS|V

→ 40000010c3e4d0462|NNS|S|user1|S|S9cb4758037a95c01T0439915|S|USER_AGENT|S|#|...
← 40000010c3e4d0462|NNS|EX|No+more+than+one+session+allowed|-1101|#|
S8f3da29cfc463220T5454537
```

Notify Session Close

Direction: from Proxy Adapter to counterpart

Expects reply: yes
Method tag: NSC

Data segments:

- 1 *session ID*, as string

<ID>|NSC|S|<session ID>

Expected reply data segments: none, a void is expected

<ID>|NSC|V

Reply can also be an exception of *Generic* or *Notification* type.

Examples:

```
→ 20000010c3e4d0462|NSC|S|S8f3da29cfc463220T5454537
← 20000010c3e4d0462|NSC|V

→ 30000010c3e4d0462|NSC|S|S9cb4758037a95c01T0439915
← 30000010c3e4d0462|NSC|EN|Session+not+open
```

Get Items

Direction: from Proxy Adapter to counterpart
Expects reply: yes
Method tag: GIS

Data segments:

- 1 *user name*, as string (can be null for the anonymous user)
- 1 *item group name (or item list specification)*, as string
- 1 *session ID*, as string

<ID>|GIS|S|<user name>|S|<item group name>|S|<session ID>

Expected reply data segments:

- N *item names*, as string

<ID>|GIS|S|<item 1>|S|<item 2>|...|S|<item N>

Reply can also be an exception of *Generic* or *Items* type.

Examples:

```
→ 50000010c3e4d0462|GIS|S|#|S|nasdaq100_AA_AL|S|S8f3da29cfc463220T5454537
← 50000010c3e4d0462|GIS|S|aapl|S|atvi|S|adbe|S|akam|S|altr

→ 60000010c3e4d0462|GIS|S|#|S|nasdaq100_AA_AL|S|S9cb4758037a95c01T0439915
← 60000010c3e4d0462|GIS|EI|Unknown+group
```

Get Schema

Direction: from Proxy Adapter to counterpart

Expects reply: yes
Method tag: GSC

Data segments:

- 1 *user name*, as string (can be null for the anonymous user)
- 1 *item group name (or item list specification)*, as string
- 1 *field schema name (or field list specification)*, as string
- 1 *session ID*, as string

```
<ID>|GSC|S|<user name>|S|<item group name>|S|<field schema name>|S|<session ID>
```

Expected reply data segments:

- N *field names*, as string

```
<ID>|GSC|S|<field 1>|S|<field 2>|...|S|<field N>
```

Reply can also be an exception of *Generic*, *Items* or *Schema* type.

Examples:

```
→ 70000010c3e4d0462|GSC|S|#|S|nasdaq100_AA_AL|S|short|S|S8f3da29cfc463220T5454537
← 70000010c3e4d0462|GSC|S|last_price|S|time|S|pct_change

→ 80000010c3e4d0462|GSC|S|#|S|nasdaq100_AA_AL|S|short|S|S9cb4758037a95c01T0439915
← 80000010c3e4d0462|GSC|ES|Unknown+schema
```

Get Item Data

Direction: from Proxy Adapter to counterpart
Expects reply: yes
Method tag: GIT

Data segments:

- N *item names*, as string

```
<ID>|GIT|S|<item 1>|S|<item 2>|...|S|<item N>
```

Expected reply data segments:

- N *item data structures*, composed by:
 - 1 *distinct snapshot length*, as integer
 - 1 *min source frequency*, as double
 - 1 *allowed modes*, as Mode array

```
<ID>|GIT|I|<dist. snapsh. len. 1>|D|<min source freq. 1>|M|<all. modes 1>|...
...|I|<dist. snapsh. len. N>|D|<min source freq. N>|M|<all. modes N>
```

As you can see, this method replaces the *getDistinctSnapshotLength*, *getMinSourceFrequency* and *modeMaybeAllowed* methods of the Java interface.

Reply can also be an exception of *Generic* type.

Examples:

```

→ 90000010c3e4d0462|GIT|S|aapl|S|atvi
← 90000010c3e4d0462|GIT|I|10|D|0|M|RMDC|I|30|D|0.01|M|R

→ a0000010c3e4d0462|GIT|S|aapl|S|atvi
← a0000010c3e4d0462|GIT|E|Database+connection+error

```

Get User Item Data

Direction: from Proxy Adapter to counterpart
 Expects reply: yes
 Method tag: GUI

Data segments:

- 1 *user name*, as string (can be null for the anonymous user)
- N *item names*, as string

```
<ID>|GUI|S|<user name>|S|<item 1>|S|<item 2>|...|S|<item N>
```

Expected reply data segments:

- N *user item data structures*, composed by:
 - 1 *allowed buffer size*, as integer
 - 1 *allowed max frequency*, as double
Edition note: A further global frequency limit could also be imposed by the Server, depending on Edition and License Type. To know what features are enabled by your license, please see the License tab of the Monitoring Dashboard (by default, available at /dashboard).
 - 1 *allowed modes*, as Mode array

```
<ID>|GUI|I|<all. buf. size 1>|D|<all. max freq. 1>|M|<all. modes 1>|...
...|I|< all. buf. size N>|D|<all. max freq. N>|M|<all. modes N>
```

As you can see, this method replaces the *getAllowedBufferSize*, *getAllowedMaxItemFrequency* and *isModeAllowed* methods of the Java interface.

Reply can also be an exception of *Generic* type.

Examples:

```

→ b0000010c3e4d0462|GUI|S|user1|S|aapl|S|atvi
← b0000010c3e4d0462|GUI|I|30|D|3|M|RMDC|I|30|D|0.3|M|$

→ c0000010c3e4d0462|GUI|S|#|S|aapl|S|atvi
← c0000010c3e4d0462|GUI|E|Database+connection+error

```

Notify User Message

Direction: from Proxy Adapter to counterpart
 Expects reply: yes
 Method tag: NUM

Data segments:

- 1 *user name*, as string (can be null for the anonymous user)
- 1 *session ID*, as string
- 1 *user message*, as string

```
<ID>|NUM|S|<user name>|S|<session ID>|S|<user message>
```

Expected reply data segments: none, a void is expected

```
<ID>|NUM|V
```

Reply can also be an exception of *Generic*, *Notification* or *Credits* type; for Credits exceptions, the error code must be either 0 or negative.

Examples:

```
→ d0000010c3e4d0462|NUM|S|user1|S|S8f3da29cfc463220T5454537|S|stop+logging
← d0000010c3e4d0462|NUM|V

→ e0000010c3e4d0462|NUM|S|#|S|S9cb4758037a95c01T0439915|S|start+logging
← e0000010c3e4d0462|NUM|EC|Anonymous+user+logging+not+allowed|-1095|#
```

Notify New Tables

Direction: from Proxy Adapter to counterpart

Expects reply: yes

Method tag: NNT

Data segments:

- 1 *user name*, as string (can be null for the anonymous user)
- 1 *session ID*, as string
- N *table (i.e. subscription) info structures*, composed by:
 - 1 *window index*, as integer
 - 1 *publishing mode*, as 1-length Mode array
 - 1 *item group name (or item list specification)*, as string
 - 1 *field schema name (or field list specification)*, as string
 - 1 *index of the first item*, as integer
 - 1 *index of the last item*, as integer
 - 1 *selector*, as string (can be null if no selector is associated)

(BTW selector information is currently redundant, as any request with a non-null selector has already been refused)

```
<ID>|NNT|S|<user name>|S|<session ID>|
I|<win. index 1>|M|<pub. mode 1>|S|<item group 1>|
S|<field schema 1>|I|<first item idx. 1>|I|<last item idx. 1>|S|<selector 1>|
...
I|<win. index N>|M|<pub. mode N>|S|<item group N>|
S|<field schema N>|I|<first item idx. N>|I|<last item idx. N>|S|<selector N>
```

Expected reply data segments: none, a void is expected

```
<ID>|NNT|V
```

Reply can also be an exception of *Generic*, *Notification* or *Credits* type; for Credits exceptions, the error code must be either 0 or negative.

Examples:

```

→      f0000010c3e4d0462|NNT|S|#|S|S8f3da29cfc463220T5454537|I|1|M|M|
S|nasdaq100_AA_AL|S|short|I|1|I|5|S|#
←      f0000010c3e4d0462|NNT|V

→      10000010c3e4d0462|NNT|S|#|S|S9cb4758037a95c01T0439915|I|1|M|M|
S|nasdaq100_AA_AL|S|short|I|1|I|5|S|#
←      10000010c3e4d0462|NNT|EN|Session+timed+out

```

Notify Tables Close

Direction: from Proxy Adapter to counterpart

Expects reply: yes

Method tag: NTC

Data segments:

- 1 *session ID*, as string
- N *table (i.e. subscription) info structures*, composed by:
 - 1 *window index*, as integer
 - 1 *publishing mode*, as 1-length Mode array
 - 1 *item group name (or item list specification)*, as string
 - 1 *field schema name (or field list specification)*, as string
 - 1 *index of the first item*, as integer
 - 1 *index of the last item*, as integer
 - 1 *selector*, as string (can be null if no selector is associated)

(BTW selector information is currently redundant, as any request with a non-null selector has already been refused)

```

<ID>|NTC|S|<session ID>|
I|<win. index 1>|M|<pub. mode 1>|S|<item group 1>|
S|<field schema 1>|I|<first item idx. 1>|I|<last item idx. 1>|S|<selector 1>|
...
I|<win. index N>|M|<pub. mode N>|S|<item group N>|
S|<field schema N>|I|<first item idx. N>|I|<last item idx. N>|S|<selector N>

```

Expected reply data segments: none, a void is expected

```
<ID>|NTC|V
```

Reply can also be an exception of *Generic* or *Notification* type.

Examples:

```

→      f0000010c3e4d0462|NTC|S|S8f3da29cfc463220T5454537|I|1|M|M|
S|nasdaq100_AA_AL|S|short|I|1|I|5|S|#
←      f0000010c3e4d0462|NTC|V

→      10000010c3e4d0462|NTC|S|S9cb4758037a95c01T0439915|I|1|M|M|
S|nasdaq100_AA_AL|S|short|I|1|I|5|S|#
←      10000010c3e4d0462|NTC|EN|Table+not+open

```

Notify MPN Device Access

Edition note: Push Notifications is an optional feature, available depending on Edition and License Type. To know what features are enabled by your license, please see the License tab of the Monitoring Dashboard (by default, available at /dashboard).

Direction: from Proxy Adapter to counterpart

Expects reply: yes

Method tag: MDA

Data segments:

- 1 *user name*, as string
- 1 *session ID*, as string
- 1 *mobile platform type*
- 1 *application ID* (a.k.a. *package name*), as string
- 1 *device token* (a.k.a. *registration ID*), as string

```
<ID>|MDA|S|<user name>|P|<platform type>|S|<application ID>|S|<device token>
```

Expected reply data segments: none, a void is expected

```
<ID>|MDA|V
```

Reply can also be an exception of *Credits* or *Notification* type; for Credits exceptions, the error code must be either 0 or negative.

Example:

```
→ b00000147c9bc4c74|MDA|S|$|S|<session ID>|P|A|S|
com.lightstreamer.demo.ios.stocklistdemo|S|
f780e9d8ffc86a5ec9a329e7745aa8fb3a1ecce77c09e202ec24cff14a9906f1
← b00000147c9bc4c74|MDA|V
```

Notify MPN Subscription Activation

Edition note: Push Notifications is an optional feature, available depending on Edition and License Type. To know what features are enabled by your license, please see the License tab of the Monitoring Dashboard (by default, available at /dashboard).

Direction: from Proxy Adapter to counterpart

Expects reply: yes

Method tag: MSA

Data segments:

- 1 *user name*, as string
- 1 *session ID*, as string
- 1 *table* (i.e. *subscription*) *info structure*, composed by:
 - 1 *window index*, as integer
 - 1 *publishing mode*, as 1-length Mode array
 - 1 *item group name* (or *item list specification*), as string
 - 1 *field schema name* (or *field list specification*), as string
 - 1 *index of the first item*, as integer
 - 1 *index of the last item*, as integer
- 1 *MPN subscription info structure*, composed by:
 - 1 *mobile platform type*
 - 1 *application ID*, as string
 - 1 *device token*, as string

- 1 *trigger expression*, as string
- 1 *notification format*, as string

The “notification format” field is a descriptor of the push notifications format of this subscription. The structure of the format descriptor depends on the platform type and it is represented in json.

```
<ID>|MSA|S|<user name>|S|<session ID>|
  I|<win. index>|M|<pub. mode>|S|<item group>|S|<field schema>|
  I|<first item idx.>|I|<last item idx.>|
  P|A|S|<application ID>|S|<device token>|S|<trigger>|
  S|<notification format>
```

Expected reply data segments: none, a void is expected

```
<ID>|MSA|V
```

Reply can also be an exception of *Credits* or *Notification* type; for Credits exceptions, the error code must be either 0 or negative.

```

1.6 Data Provider Protocol Methods

Data Provider protocol aims at exposing the DataProvider Java interface methods through the protocol. To find the best trade-off between pros of interface remotizing and cons of protocol overhead, some of the original Java interface methods have not been remotized, and others have been aggregated. In particular, the “smart” version of the data exchange is not possible here and having different flavors of *update* is of no advantage. In addition, *setListener* is obviously not needed. On the other hand, *isSnapshotAvailable* has not been ported and it is implemented by the Proxy Adapter to always return true. As a consequence, upon subscription, the Remote Adapter is always due to send the item snapshot; if no snapshot information is available, an empty snapshot should be specified.

For more explanations regarding the semantics of each information, please consult the interface API documentation, either on Java API docs or (for an implementation example) on .Net API docs included in the distributions.

Data Init

Direction: from Proxy Adapter to counterpart
 Expects reply: yes
 Method tag: DPI

Data segments:

- *N initialization parameter name-value pairs*, both names and values as string

The parameters are supplied by the Proxy Adapter based on its own configuration in an unspecified order.

A parameter named “ARI.version” will always be supplied, to carry the maximum protocol version supported by the Proxy Adapter.

A parameter named “keepalive_hint.millis”, if present, specifies the inactivity time after which a keepalive packet should be issued on the channel (either reply or notify) to prevent the Proxy Adapter from closing the channel for inactivity. Note that the value is a number, but encoded as a string.

```
<ID>|DPI|S|<param 1>|S|<param 1 value>|...|S|ARI.version|S|<version>|...|S|
<param N>|S|<param N value>
```

Expected reply data segments:

- *N initialization parameter name-value pairs*, both names and values as string

The supplied parameters are handled by the Proxy Adapter based on its own configuration and regardless of their order.

A parameter named “ARI.version” is mandatory, to carry the protocol version that the Remote Adapter is willing to use. Based on it, the Proxy Adapter will either proceed or interrupt the connection. If it is lower than the request’s ARI.version, the Proxy Adapter may still support it and proceed. If it is higher, the Proxy Adapter will interrupt (the Proxy Adapter will recognize the response, regardless of its protocol version); in this case, returning a Generic Exception (see below) is also an option.

```
<ID>|DPI|S|<param 1>|S|<param 1 value>|...|S|ARI.version|S|<version>|...|S|
<param N>|S|<param N value>
```

Reply can be also an exception of *Generic* or *Data* type. This will cause the Proxy Adapter to interrupt the connection. The Proxy Adapter will recognize such response, regardless of its protocol version.

Examples:

```
→ 10000010c3e4d0462|DPI|S|ARI.version|S|1.8.2|S|keepalive_hint.millis|S|8000|S|
adapters_conf.id|S|DEMO|S|data_provider.name|S|STOCKLIST|...
← 10000010c3e4d0462|DPI|S|ARI.version|S|1.8.2

→ 10000010c3e4d0462|DPI|S|ARI.version|S|1.8.2|S|adapters_conf.id|S|DEMO|S|
data_provider.name|S|STOCKLIST|...
← 10000010c3e4d0462|DPI|S|ARI.version|S|1.8.2|S|user|S|remote1|S|password|S|
fdhjkslghak

→ 20000010c3e4d0462|DPI|S|ARI.version|S|1.8.2|S|custom:feed_name|S|feed1|S|
custom:feed_port|S|8080|...
← 20000010c3e4d0462|DPI|ED|Data Feed unavailable
```

Subscribe

Direction: from Proxy Adapter to counterpart

Expects reply: yes

Method tag: SUB

Data segments:

- *1 item name*, as string

```
<ID>|SUB|S|<item name>
```

Expected reply data segments: none, a void is expected

```
<ID>|SUB|V
```

Reply can also be an exception of *Generic*, *Subscription* or *Failure* type.

Examples:

```

→ 10000010c3e4d0462|SUB|S|aapl
← 10000010c3e4d0462|SUB|V

→ 20000010c3e4d0462|SUB|S|xyzy
← 20000010c3e4d0462|SUB|EU|Unknown+item

```

Unsubscribe

Direction: from Proxy Adapter to counterpart
 Expects reply: yes
 Method tag: USB

Data segments:

- 1 *item name*, as string

```
<ID>|USB|S|<item name>
```

Expected reply data segments: none, a void is expected

```
<ID>|USB|V
```

Reply can also be an exception of *Generic*, *Subscription* or *Failure* type.

Examples:

```

→ 30000010c3e4d0462|USB|S|aapl
← 30000010c3e4d0462|USB|V

→ 40000010c3e4d0462|USB|S|xyzy
← 40000010c3e4d0462|USB|EU|Item+not+subscribed

```

End Of Snapshot

Direction: from counterpart to Proxy Adapter (notify)
 Expects reply: no
 Method tag: EOS

Data segments:

- 1 *item name*, as string
- 1 *unique ID of the originating subscription request*, as string

```
<timestamp>|EOS|S|<item name>|S|<ID>
```

Examples:

```
→ 1152096504423|EOS|S|aapl|S|10000010c3e4d0462
```

Update By Map

Direction: from counterpart to Proxy Adapter (notify)
 Expects reply: no
 Method tag: UD3

Data segments:

- 1 *item name*, as string
- 1 *unique ID of the originating subscription request*, as string
- 1 *is snapshot flag*, as boolean
- N *field-value pairs*, composed by:
 - 1 *field name*, as string
 - 1 *field value*, as string or byte array

```
<timestamp>|UD3|S|<item name>|S|<ID>|B|<is snapshot>|S|<field 1>|S|<value 1>| ... |S|<field N>|S|<value N>
```

```
<timestamp>|UD3|S|<item name>|S|<ID>|B|<is snapshot>|S|<field 1>|Y|<value 1>| ... |S|<field N>|Y|<value N>
```

Note: the special mandatory fields for items to be requested in COMMAND mode, named “key” and “command”, must be encoded as string.

Examples:

```
→ 1152096504423|UD3|S|aapl|S|10000010c3e4d0462|B|1|S|pct_change|S|0.44|S|last_price|S|6.82|S|time|S|12%3a48%3a24
```

```
→ 1152096504423|UD3|S|aapl|S|10000010c3e4d0462|B|1|S|pct_change|Y|MC40NA==|S|last_price|Y|Ni44Mg==|S|time|Y|MTI6NDg6MjQ=
```

Clear Snapshot

Direction: from counterpart to Proxy Adapter (notify)
 Expects reply: no
 Method tag: CLS

Data segments:

- 1 *item name*, as string
- 1 *unique ID of the originating subscription request*, as string

```
<timestamp>|CLS|S|<item name>|S|<ID>
```

Examples:

```
→ 1152096504423|CLS|S|aapl|S|10000010c3e4d0462
```

Failure

Direction: from counterpart to Proxy Adapter (notify)
 Expects reply: no
 Method tag: FAL

Data segments:

- 1 *reason*, as generic exception

```
<timestamp>|FAL|E|<reason>
```

Examples:

→ 1152096504423|FAL|E|Connection+lost

1.7 Common Packets

The following packets are not part of the communication with the Adapters, but rather connection-related and may pertain to multiple channels.

Remote Adapter Credentials

Direction: from counterpart to Proxy Adapter

Channels:

- Metadata Adapter reply channel
- Data Adapter reply channel
- Data Adapter notification channel

Method tag: RAC

When sent on a reply channel, it takes the form of an unsolicited reply, where the implicit request ID must be set as 1.

When sent on a notification channel, it takes the form of a normal notify.

For Server version 7.1 and above, the Proxy Adapter will always recognize the message. However, the message contents will be recognized depending on the Server version.

If Remote Adapter authentication is configured on the Proxy Adapter for a Remote Adapter, the packet is mandatory and should be the first packet sent on all related channels. If the credentials are refused, the Proxy Adapter will ignore any other packet and will interrupt the connection.

Data segments:

- *N initialization parameter name-value pairs*, both names and values as string

The supplied parameters are handled by the Proxy Adapter regardless of their order. For Server version 7.1 and above, parameters with names “user” and “password” must be provided to specify the credentials.

For Server version 7.2 and above, a parameter with name “enableClosePacket” and value “true” on a reply channel will request the Proxy Adapter to issue a `CLOSE` packet in case of connection interruption for any reason. If not sent, the `CLOSE` packet will be enabled only after the response to the `MPI/DPI` packet.

As a reply:

```
1|RAC|S|<param 1>|S|<param 1 value>|...|S|<param N>|S|<param N value>
```

As a notify:

```
<timestamp>|RAC|S|<param 1>|S|<param 1 value>|...|S|<param N>|S|<param N value>
```

Examples:

As a reply:

```
← 1|RAC|S|user|S|remotel|S|password|S|fdhjkslghak|S|enableClosePacket|S|true
```

As a notify:

```
← <timestamp>|RAC|S|user|S|remotel|S|password|S|fdhjkslghak
```

Keepalive

Direction: from counterpart to Proxy Adapter

Channels:

- Metadata Adapter reply channel
- Data Adapter reply channel
- Data Adapter notification channel

Method tag: `KEEPALIVE`

The packet has a special syntax, independent from the channel, as specified in the introductory notes.

Examples:

```
←      KEEPALIVE
```

Close Notification

Direction: from Proxy Adapter to counterpart

Channels:

- Metadata Adapter request channel
- Data Adapter request channel

Method tag: `CLOSE`

The packet takes the form of a request with no possible reply, where the implicit request ID is always set as 0.

Data segments:

- *N closure parameter name-value pairs, both names and values as string*

The parameters are supplied by the Proxy Adapter in an unspecified order.

A parameter named “reason” will always be supplied, to carry a text message describing the reason for an ongoing connection interruption.

The syntax is predisposed for the introduction of other parameters in future versions of the protocol.

```
0|CLOSE|S|<param 1>|S|<param 1 value>|...|S|reason|S|<close reason>|...|S|  
<param N>|S|<param N value>
```

No reply is expected.

Note: this packet is sent by the Proxy Adapter upon an ordered closure of the connection. Obviously, an abrupt closure of the connection, without this packet, is always possible.

Examples:

```
→      0|CLOSE|S|reason|S|keepalive timeout
```

1.8 Notes on Protocol Method Sequence

Metadata Init, Data Init

The proper *Init* method is the very first request sent from the Java proxy to the counterpart. In this way, the Proxy Adapter can send initialization parameters to the Remote Adapter (based on its own configuration) before starting to issue requests. The Proxy Adapter won't send any request until the *Init* method sends back a successful response.

Remote Adapter Credentials

The *Remote Adapter Credentials* packet is optional. However, the Proxy Adapter, depending on its current configuration, may request this packet, to receive suitable identification information, before sending the proper *Init* method on request channels and before accepting other notifies on notification channels.

In any case, the packet is valid only if it is the first one sent on the channel.

Notify User

The *Notify User* method is invoked before any other requests for the same user (which version is used depends on the configuration of `<use_client_auth>`; by default, the base version is used). This means that the Metadata Adapter has always a chance to authenticate users before any detail about their profile is requested.

Notify User, Notify New Session

All the authorization request management is expected to depend on the user name only. Anyway, some information on the specific client request instance are supplied to the *Notify New Session* method, as the *client context*. The *REQUEST_ID* property is the same id that has just been supplied to *Notify User* for the same client request instance; this allows for using local authentication-related details for the authorization task.

Note: the Remote Adapter is responsible for disposing any cached information in case *Notify New Session* is not issued because of any early error during request management.

Notify New Tables, Notify Tables Close

These methods are requested by the Proxy Adapter only when the Remote Adapter asks for them through the *wants table (i.e. subscription) notifications flag* returned with the *Notify User* method, on a user basis. If this flag is always returned as false, then these calls are never received.

Notify User, Notify New Tables, Notify New Session, Notify User Message, Get Items, Get Schema, Get Item Data, Get User Item Data

These methods are requested by the Proxy Adapter synchronously (i.e.: the requesting thread waits for the reply; however, the Proxy Adapter may still issue multiple requests in parallel, as stated in the general notes). Moreover, the requesting threads are taken from a limited pool.

This means that these requests should be processed as fast as possible; but, anyway, any roundtrip delay related to the remote call will keep the Server waiting.

In order to avoid that delays on one session propagate to other sessions, the size of the thread pool devoted to the management of the client requests should be properly set, through the "server_pool_max_size" flag, in the Server configuration file.

Alternatively, a dedicated pool, properly sized, can be defined for the involved Adapter Set in "adapters.xml". Still more restricted dedicated pools can be defined:

- for the *Notify User* method only,
- for the *Notify User Message* method only,

- for each Data Adapter in the Adapter Set.

The latter pool would also run any Metadata Adapter method related to the items supplied by the specified Data Adapter.

Notify New Tables, Notify Tables Close

If desired, invocations of these methods, when related to the same session, can be performed by the Server sequentially. This can be achieved by leveraging the `<sequentialize_table_notifications>` flag available in the Proxy Metadata Adapter configuration. Obviously, this would mean that any delay or roundtrip time involved may keep further subscription requests for the same session blocked.

Notify Tables Close, Notify Session Close, Subscribe, Unsubscribe

These methods are requested by the Proxy Adapter side asynchronously (i.e.: without waiting for the reply). This does not mean that the reply should not be sent: the reply is mandatory (or a timeout exception will be raised on the Proxy Adapter side), but any exception that it should carry would simply be logged. Anyway, this means that these methods don't need to be non-blocking, as long as they don't last more than the configured timeout limit.

Notify New Session, Notify Session Close

These methods are invoked consistently. *Notify New Session* always precedes other methods related with the same session and *Notify Session Close* always follows other methods related with the same session.

To be more precise, after *Notify Session Close*, no more calls to *Notify New Tables* and *Notify Tables Close* for this session ID are possible. On the other hand, trailing invocations of methods related with the validation of client requests, like *Get Items*, are still possible and accepting them would have no effect. However, if the method may have side-effects on the Adapter, like *Notify User Message*, the Adapter is responsible for checking if the session is still valid.

Subscribe, Unsubscribe

These methods are invoked consistently. *Subscribe* always precedes *Unsubscribe* for the same item; after *Unsubscribe*, a further *Subscribe* is possible, and so on. However, the Proxy Adapter doesn't wait for the answer to *Subscribe* or *Unsubscribe* before issuing the next invocation, if needed. So, it is possible that multiple *Subscribe-Unsubscribe* requests are pending at the same time.

Subscribe, End Of Snapshot, Update By Map

As pointed out in the previous paragraph, upon *Subscribe*, the Remote Adapter is always due to provide the Proxy Adapter with snapshot information. This is done by sending *Update By Map* notifies with the "is snapshot" flag set to true and a terminating *End Of Snapshot* notify. This should be done as soon as possible and must precede any real-time updates carried by *Update By Map*. In case no snapshot information is available, an empty snapshot should be sent.

End Of Snapshot, Update By Map, Clear Snapshot

As said above, the optional initial snapshot and the terminating *End Of Snapshot* notify should be sent first thing. Actually, the *End Of Snapshot* notify can be omitted and in that case the subsequent *Update By Map* with the “is snapshot” flag set to false will imply snapshot termination. But note that this would be equivalent only if the *Update By Map* came immediately; otherwise, the Server would, pointlessly, keep waiting for more snapshot to come. Similarly, a *Clear Snapshot* notify should only occur after snapshot termination; otherwise, it would imply snapshot termination as well.

Keepalive

Keepalive packets can be sent on any channel at any moment. The Proxy Adapter may be configured to close the connections after an inactivity period. Sending a *Keepalive* packet when no other activity is in place will prevent this.

Close Notification

A *Close Notification* packet can be sent by the Proxy Adapter as the last one before connection interruption. The presence of this packet adds no guarantee that the latest responses sent by the Remote Adapter have been processed by the Proxy Adapter. The *Close Notification* packet is enabled on the Proxy Adapter after receiving the response to the *Init* packet, which establishes the protocol version. Before that, it can be enabled through the *Remote Adapter Credentials* packet.
